

1. Planning the Order

- The vendor sets up their shop by adding products, categories, location, and working hours into the system.
- The customer browses the platform, selects items, and adds them to the cart. They then provide personal details to proceed.

2. Handling the Payment

- The system sends a payment request to Apple Pay or Google Pay.
- These payment methods process the transaction securely through the Stripe Payment Gateway.
- After successful payment, confirmation is sent back to the system to finalize the order.

3. Locating and Assigning

- The system sends location data to the location service and receives exact coordinates.
- It then checks pending deliveries and assigns the order to an available delivery agent.

4. Fulfillment and Delivery

- The vendor receives the order details and prepares the items.
- The delivery agent picks up the order and delivers it to the customer.
- The system continuously updates the customer with order confirmation and tracking information until delivery is complete.
